What is the MIC-KEY* Jejunal Feeding Tube?

The MIC-KEY* J-tube is a feeding tube that goes into your stomach through an opening in your abdominal wall, known as a "stoma." There is a balloon on the tube which is inflated with

water and sits on the inside of your stomach. The feeding tube passes through your stomach and terminates in the small bowel. The MIC-KEY* J-tube head (external bolster) sits outside of the abdominal wall approximately 2-3 mm above the skin. Both the internal balloon and the MIC-KEY* J-tube head help to keep your feeding tube in place and prevent it from falling out. The tube is available in multiple sizes to make sure it can meet your needs.

The MIC-KEY* J-tube is made of silicone that is safe for use in humans. The tube also contains a stripe down the side so that it is visible on x-ray.

What is a MIC-KEY* Jejunal Feeding Tube used for?

The MIC-KEY* J-tube is intended to be used in a person who cannot absorb adequate nutrition through the stomach. This tube can be used to deliver prescribed food, medicine, and water that your body requires directly into your small intestine.

How do you use a MIC-KEY* Jejunal Feeding Tube after it has been placed?

Always wash your hands with warm soapy water before touching your tube.

Flushing: Always use a MIC-KEY* extension set to flush your MIC-KEY* J-tube. The tube should be flushed every 4-6 hours while it is being used for feeding, anytime feeding is stopped, or at least every 8 hours if the tube is not being used. The tube should be flushed

before and after giving medicine. To flush, use a 30-60 ml syringe with room temperature water or sterile water where municipal water supplies is of concern. Do not use acidic juices or sodas to flush. Do not use excessive force to flush, as this can damage the tube and cause injury. Do not use a syringe directly in the extension set port (labelled jejunal access) as this can damage the tube valve and cause leakage.

Feeding: Open the cap to the extension set port (labelled jejunal access) and connect the extension set to the tube by aligning the black line on your MIC-KEY* extension set connector with the black line on the MIC-KEY* J-tube head (Figure 2). Lock the extension set in place by turning the connector clockwise until there is slight resistance (about ¾ turn). Do not turn the

connector past the stop point. Connect the feed set to the MIC-KEY* extension set. Deliver nutrition according to your healthcare professional's instructions. Make sure not to over-tighten the connection to the MIC-KEY* extension set and ensure any clamps on the extension set are opened before starting to feed.

Fig. 2

Medication Delivery: Medication should be delivered through a MIC-KEY* extension set after it has been connected to your MIC-KEY* J-tube. Use liquid medication if possible. If your pharmacist says it's safe, crush solid medication to a fine powder and dissolve in warm water before putting it through the MIC-KEY* extension set attached to your MIC-KEY* J-tube. Follow your pharmacist's instructions. Do not mix medication with formula. Always remember to flush your tube with water before, between, and after medication administration. The amount of water that you flush with will be determined by your healthcare professional.

How do you take care of your MIC-KEY* Jejunal Feeding Tube after it has been placed?

Tube Care: Follow your healthcare professional's instructions. Check the MIC-KEY* J-tube daily for any signs of damage or clogging. Clean the MIC-KEY* extension set port (labelled jejunal access), balloon inflation port, external components and the MIC-KEY* extension set with a cotton-tipped applicator or soft cloth to remove all residual formula and medication. Do not insert cotton-tipped applicators into the extension set port.

Check the stoma site daily for any signs of infection such as redness, irritation, swelling, tenderness, rashes or discharge. The stoma site, the MIC-KEY* J-tube and MIC-KEY* extension set should be cleaned daily using warm water and mild soap. Make sure to keep the tube and skin around the stoma clean and dry. Do not use mineral oil or petroleum-based products. Be careful not to pull the tube too much. **Do not rotate the tube.**

Clogging: If the tube becomes clogged, connect a MIC-KEY* extension set to the MIC-KEY* J-tube extension set port. Gently apply mild alternating suction and pressure using a 30-60 ml syringe of warm water to dislodge the clog. If the clog cannot be removed, do not use force, and call your healthcare professional.

Balloon Care: Once the stoma site is fully healed, the balloon volume should be checked once a week by removing the water with a syringe and comparing the amount removed to the recommended amount. Refill the balloon and, if needed, add additional water to meet the recommended amount. Wait 10-20 minutes and repeat. If the amount of water is different from the recommended fill volume, then the tube should be replaced. If the balloon is damaged, secure the tube in place using tape, then call your healthcare professional for instructions.

Do not use air or saline to fill the balloon. Air can leak out of the balloon causing it to collapse, and saline can crystallise over time causing clogs. Do not overinflate the balloon, as that can block the tube and decrease the life expectancy of the balloon.

How long does a MIC-KEY* Jejunal Feeding Tube last?

The balloon can last 1-8 months. This depends on various factors such as the volume of water used to inflate the balloon (always use the exact amount that your healthcare professional recommends), stomach pH, and tube care.

Is the MIC-KEY* Jejunal Feeding Tube MRI compatible?

MIC-KEY* J-tubes can be safely worn while getting an MRI under certain conditions. Talk to your healthcare professional if you need to get an MRI.

What are possible side effects of having a MIC-KEY* Jejunal Feeding Tube?

Side effects may include skin irritation or infection, ulcers, sores, or gastrointestinal leakage. Contact your healthcare professional if you experience stomach pain or discomfort, dizziness or fainting, unexplained fever, or an unusual amount of bleeding or leakage through or around the tube.

There is a risk that if the internal balloon fails on the MIC-KEY* J-tube, the tube could fall out. There could be leakage of gastric content around the tube. The tube could become blocked or clogged if it is not properly flushed and cared for before and after feedings.

How do you report adverse events?

Report any adverse events you believe are related to use of the MIC-KEY* Jejunal Feeding Tube to:

- Your physician for a correct clinical assessment or Avanos Medical by contacting Customer Service
P: 1800 101 021
E: customerservice.ANZ@avanos.com
- Therapeutic Goods Administration at <http://www.tga.gov.au/> using the "Report a Problem" or "Adverse Event" links.
